Build Night Two!

Driving back home after printing out the vulnerability scan report

Review from last week's homework

- CVE (Common Vulnerabilities & Exposures)

- When2Meet schedule
  - Second When2Meet form for next week

Open source software from GitHub

- GitHub Explore allows you to discover open source software that we can use in our project.

- The code/software must be complex, but not too complex (i.e. not something that is widely used and very complex such as the Linux kernel
  - Should not be too simple as well (harder to find vulnerabilities + should fit ACM Research's level of complexity)

- Continue looking at resources from last week if needed.

HW:

- Continue looking for the software in Github
- Fill second When2Meet in case Dr. Hamlen isn't available this week
- Review the resources from last week if you want to learn more about vulnerabilities.
